1. CHAPTER 1

Exercise 1.1. Show that equivalent definitions of manifolds are obtained if instead of allowing U to be homeomorphic to *any* open subset of \mathbb{R}^n , we require it to be homeomorphic to an open ball in \mathbb{R}^n , or to \mathbb{R}^n itself.

Proof. It is clear that a “manifold” satisfying the open-ball or \mathbb{R}^n definition satisfies the open-subset definition. Let M be a manifold satisfying the open-subset definition. Let $x \in M$ be given and let U, \hat{U}, ϕ be given according to the definition. Since \hat{U} is open, there exists an open ball B such that $\phi(x) \in B \subset \hat{U}$. Restrict ϕ to $\phi^{-1}(B)$. Then $\phi^{-1}(B)$ is an open subset of M containing x , and $\phi|_{\phi^{-1}(B)}$ is a homeomorphism between $\phi^{-1}(B)$ and B . Thus M satisfies the open-ball definition.

$B(x, r) \subset \mathbb{R}^n$ is homeomorphic to \mathbb{R}^n by the map $(x_1 + a_1, \dots, x_n + a_n) \mapsto (\frac{a_1}{r-a_1}, \dots, \frac{a_n}{r-a_n})$ where $x = (x_1, \dots, x_n)$ is the center of $B(x, r)$ and r is the radius. Since the composition of two homeomorphisms gives a homeomorphism, M also satisfies the \mathbb{R}^n definition as well. \square

Exercise 1.6. Show that \mathbb{RP}^n is Hausdorff and second-countable, and is therefore a topological n -manifold.

Proof. From the definition of π , it is easy to see that $\pi(B(x, r))$ is open in \mathbb{RP}^n where $x \in S^n$ and $0 < r < 1$.

Let $[x], [y] \in \mathbb{RP}^n$ be given. Without loss of generality, assume $x, y \in S^n$. Let $r = \min\{|x - y|, |x + y|, 1\}/2$. Then $U_x = \pi(B(x, r)), U_y = \pi(B(y, r))$ contain $[x], [y]$, respectively. $\pi^{-1}(U_x), \pi^{-1}(U_y)$ are both open in $\mathbb{R}^{n+1} \setminus \{0\}$ which can be seen easily by writing down exactly which points belong to them, so U_x, U_y are both open in \mathbb{RP}^n . Then $\pi^{-1}(U_x \cap U_y) = \pi^{-1}(U_x) \cap \pi^{-1}(U_y) = \emptyset$, so $U_x \cap U_y = \emptyset$. Therefore, \mathbb{RP}^n is Hausdorff.

Let $\mathcal{B} = \{\pi(B(x, 1/k)) \mid x \in \mathbb{Q}^{n+1} \cap S^n, k \in \{2, 3, 4, \dots\}\}$. Then \mathcal{B} is a countable collection of open sets whose union is \mathbb{RP}^n . Let $U \subset \mathbb{RP}^n$ be a nonempty open set. Let $[x] \in U$. Since π is a quotient map, $\pi^{-1}(U)$ is open. Moreover, $x \in \pi^{-1}(U)$. Without loss of generality, $x \in S^n$. Then $x \in B(x', 1/k) \subset \pi^{-1}(U)$ for some $B(x', 1/k) \in \mathcal{B}$. Then $[x] = \pi(x) \in \pi(B(x', 1/k)) \subset \pi(\pi^{-1}(U)) = U$. Therefore, \mathcal{B} is a countable basis of \mathbb{RP}^n . \square

Exercise 1.7. Show that \mathbb{RP}^n is compact.

Proof. $\pi(S^n) = \mathbb{RP}^n$ and S^n is compact because it is a closed, bounded subset of \mathbb{R}^{n+1} . (Heine-Borel) Moreover, the image of a compact set under a continuous map is compact. (See A.45(a)) Thus \mathbb{RP}^n is compact. \square

Exercise 1.14. Suppose \mathcal{X} is a locally finite collection of subsets of a topological space M .

- (a) The collection $\{\bar{X} : X \in \mathcal{X}\}$ is also locally finite.
- (b) $\overline{\bigcup_{X \in \mathcal{X}} X} = \bigcup_{X \in \mathcal{X}} \bar{X}$.

Proof.

- (a) Let $p \in M$. Then there exists an open set U containing p such that there are only finitely many $X \in \mathcal{X}$ such that $U \cap X \neq \emptyset$. Let $X \in \mathcal{X}$.
 - If $U \cap X \neq \emptyset$, then $U \cap \bar{X} \supset U \cap X \neq \emptyset$.

- If $U \cap X = \emptyset$, then U^c is closed, so $\overline{X} \subset U^c$. In other words, $U \cap \overline{X} = \emptyset$.

This shows that the number of $X \in \mathcal{X}$ that intersects U and the number of $\overline{X} \in \mathcal{X}$ that intersects U are the same. Therefore, $\{\overline{X} : X \in \mathcal{X}\}$ is also locally finite.

- (b) Since the closure of a set is defined to be the intersection of all closed sets containing it, $\bigcup_{X \in \mathcal{X}} \overline{X} \subset \overline{\bigcup_{X \in \mathcal{X}} X}$. Let $x \notin \bigcup_{X \in \mathcal{X}} \overline{X}$. Then there exists a neighborhood U of x such that U intersects only finitely many $X \in \mathcal{X}$. Let X_1, \dots, X_n denote them. By the same argument as part (a), $\overline{X_1}, \dots, \overline{X_n}$ are the only elements in $\{\overline{X} \mid X \in \mathcal{X}\}$ that U intersects. Since $x \notin \overline{X_i}$ for each $i = 1, \dots, n$, $U^c \cup \overline{X_1} \cup \dots \cup \overline{X_n}$ is a closed set which contains all $X \in \mathcal{X}$ but does not contain x . In other words, $x \notin \overline{\bigcup_{X \in \mathcal{X}} X}$.

□

Exercise 1.18. Let M be a topological manifold. Two smooth atlases for M determine the same smooth structure if and only if their union is a smooth atlas.

Proof. Let $\mathcal{A}, \mathcal{A}'$ be two smooth atlases.

Suppose that they determine the same smooth structure \mathcal{B} . Then $\mathcal{A} \cup \mathcal{A}' \subset \mathcal{B}$, so $\mathcal{A} \cup \mathcal{A}'$ must be a smooth atlas. By Proposition 1.17(a), $\mathcal{A} \cup \mathcal{A}'$ determines a unique smooth structure, but it must be \mathcal{B} because \mathcal{B} contains the union.

On the other hand, suppose that their union is a smooth atlas. Let \mathcal{B} be the smooth structure that the union determines. Such \mathcal{B} must exist by Proposition 1.17(a). By the same proposition, $\mathcal{A}, \mathcal{A}'$ must determine the unique smooth structures. However, they must be \mathcal{B} because \mathcal{B} contains both \mathcal{A} and \mathcal{A}' .
